

# Hi-Amp 3 Point Busbar

VTE has developed a fast, inexpensive, and easy way to secure high amperage connections. With our new Hi-Amp 3 Point Busbar, you can connect 4/0 ga cables to high-draw devices from a central current source.

One potential use for this busbar is for marine bow/stern thrusters and similar high current devices.

The connection plate is manufactured from nickel-plated brass, for it's high conductivity rating, and resistance to corrosion.

The posts and washers are made from stainless steel, for it's strength and resistance to corrosion encountered in marine environments.

To comply with industry standards, an optional insulator protects terminal connections from accidental shorts. To ensure complete protection, terminal sleeves should be fitted with insulating shrink-wrap.
